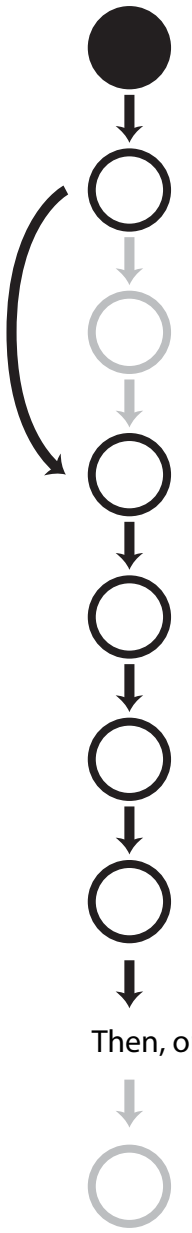
Individual



Start here

Bitbucket: Repositories > Create Repository
Get Repository URL
e.g., https://<username>@bitbucket.org/<username>/<repository>.git

Bitbucket: Settings > Access Management > Users (Add User)
Add any users if you're working in a group

Create NetBeans Project

Team > Git > Initialize Repository....

Team > Commit...

Team > Remote > Push...
Use Repository URL and Bitbucket username/password
Select local branch master and remote branch master
Choose yes if asked if master should track remote branch

Then, on any other computers...

Team

Team > Remote > Clone...

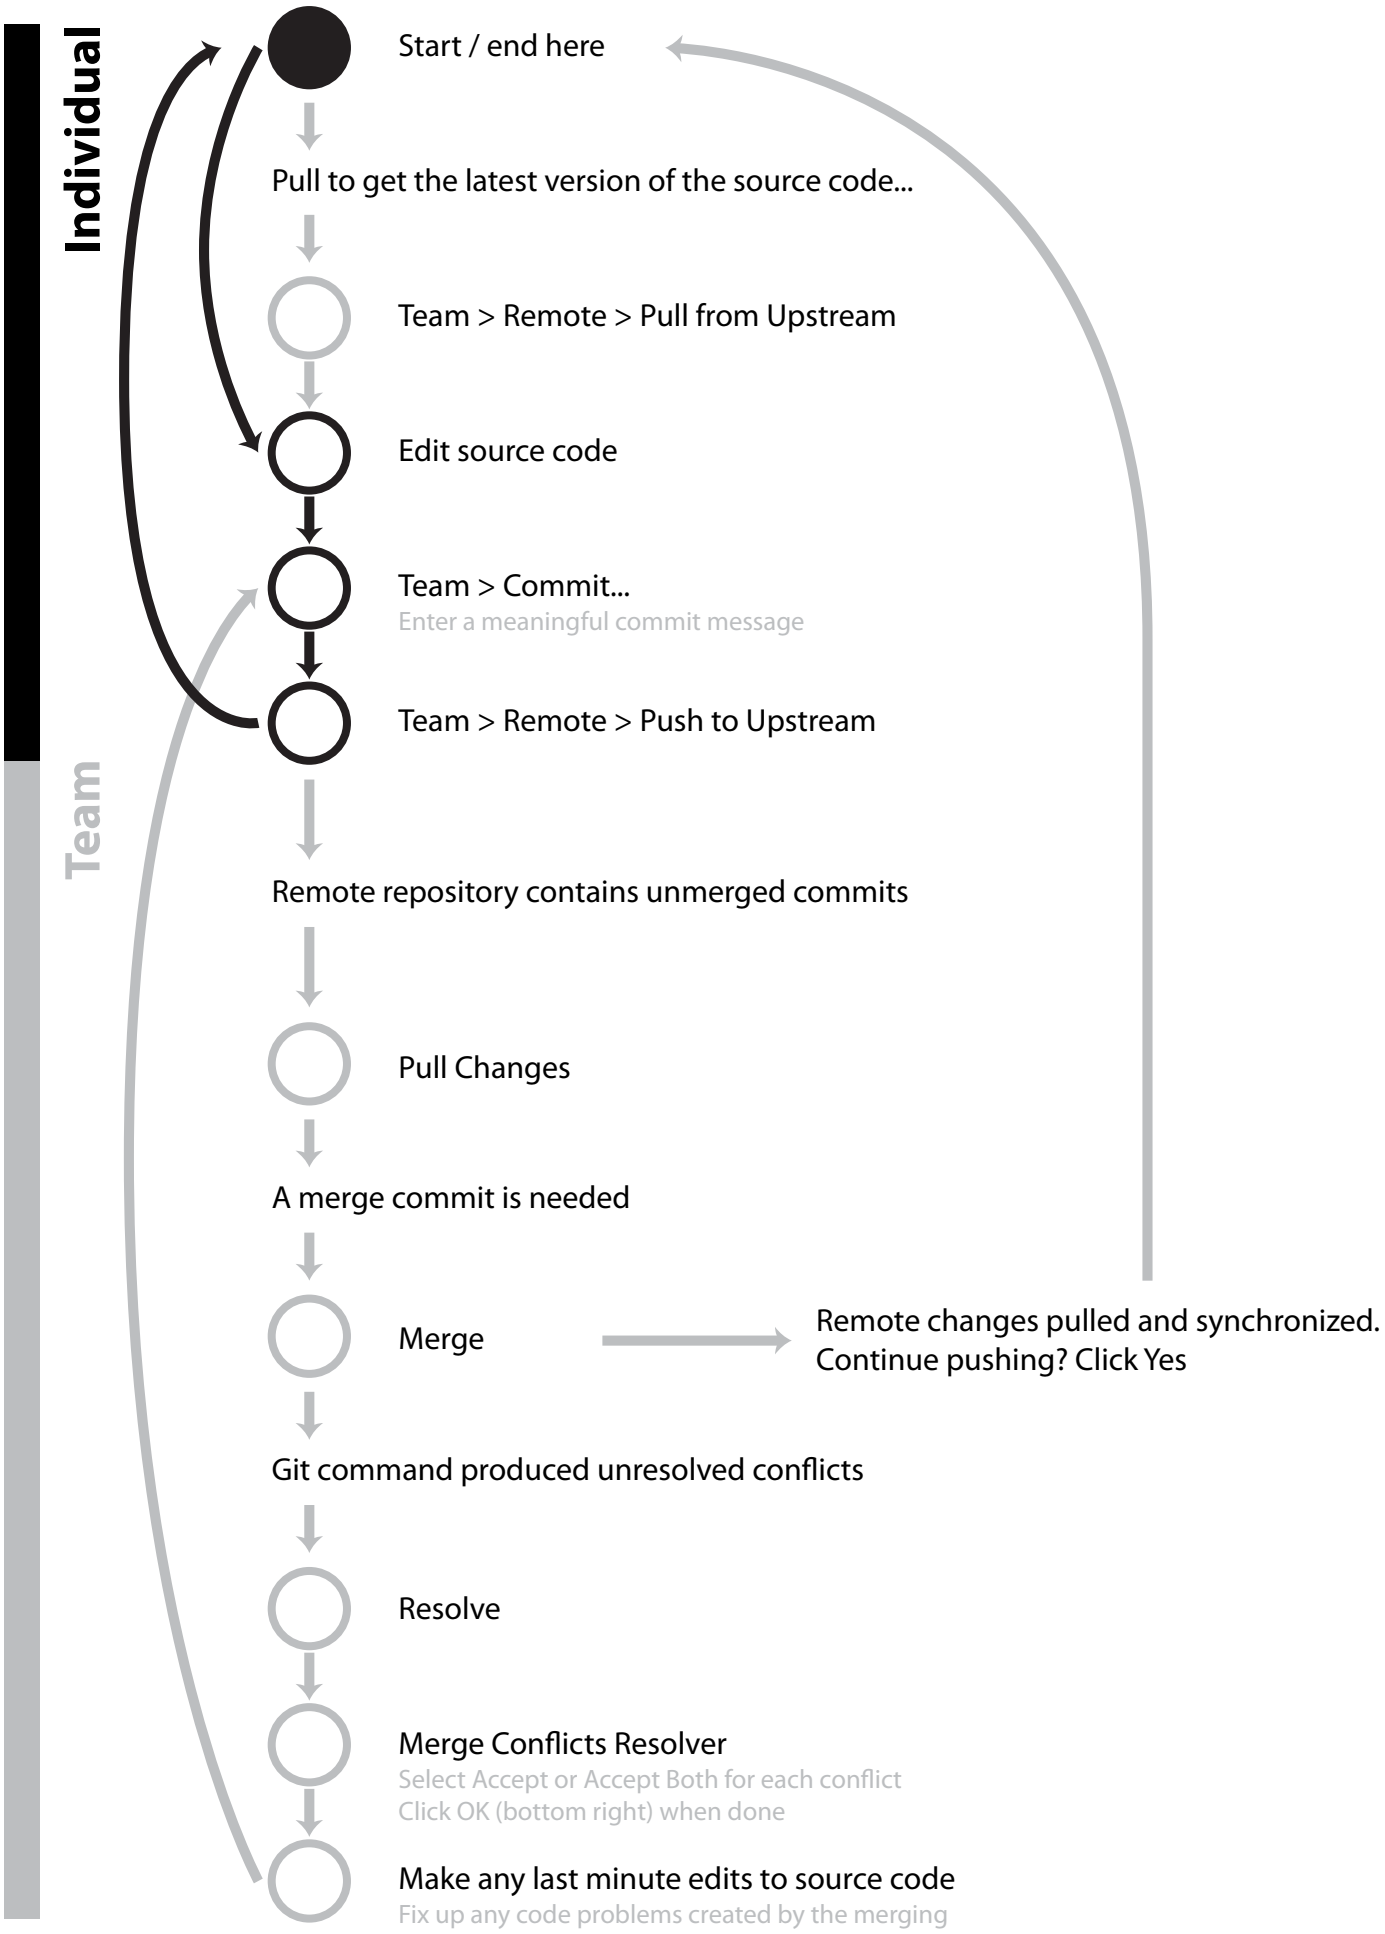
Historical Versions

Start here

Team > Checkout > Checkout Revision
Click on Select, and Select an older revision
You do not need to checkout as a new branch if you are only looking at old versions
(this creates a "detached head")

Look at the older versions

Team > Branch/Tag > Switch To Branch...
Switch to master to return back to latest version of the master branch



These notes are a simplified workflow. Your group may decide to use branches, rebasing or any workflow that suits you.
